

The QC Suite

automated testing for a multichannel world

The last decade has witnessed an unprecedented expansion in the functionality of audio and AV equipment, from relatively straightforward two-channel CD players and integrated amplifiers to highly complex multichannel DVD, SACD and universal players with partnering AV processors and receivers.

So why use test gear designed for stereo systems? Instead, the QC Suite offers a unique, multichannel solution for the development and Quality Control testing of modern AV equipment. The station combines configurable analogue and digital outputs plus six channels of 24bit acquisition (expandable to 12 channels).

- ◆ Intuitive, drag-and-drop interface with pop-up menus.
- ◆ No programming required - Test parameters are configured and Pass/Fail limits selected at the click of a mouse.
- ◆ Integrated learning IR remote and serial comms allow for fully automated, 'hands free' multichannel Test Sequences.
- ◆ Customised automated report generation, graphical analysis and printing options.
- ◆ Statistical process control enhances functional testing on the production line.
- ◆ Automated Dolby conformance testing for DVD players and AV processors*.

Still testing multichannel equipment with one or two-channel test gear? Then book an appointment with the QC Suite and drag-and-drop your way to enhanced productivity.

* Only available to Dolby Digital licencees.
